IMMUNE SYSTEM AND

PROBIOTICS

DISCOVER HOW OUR HEREDITUM® PROBIOTICS ACT ON THE IMMUNE SYSTEM BY CLICKING ON THE IMAGE BELOW:

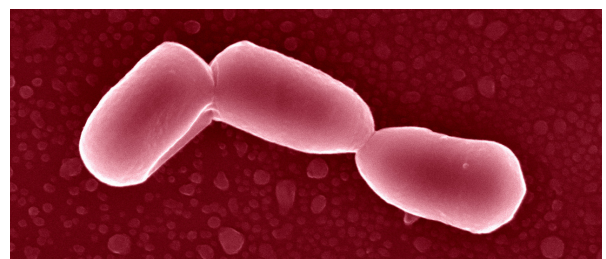

When these probiotic strains are consumed preventively through a food supplement or foods that contain them, what happens is that the **PREACTIVATED IMMUNE SYSTEM IS MAINTAINED.**

BOOSTING IMMUNE SYSTEM

The global impact of COVID-19, and given that there is currently no vaccine available, or a specific effective and clinically proven treatment, has led to the fact that boosting our immune system, along with maintaining high hygiene through hand washing and avoiding contact with infected people, are the best strategies for dealing with it.

The concern about immunity is growing and comes to stay, mainly in the most vulnerable population (elderly population, immunosuppressed, etc). In addition, we are more aware that in situations of stress or due to an inadequate diet our immune system's ability to react can be affected, making us more susceptible to infections.

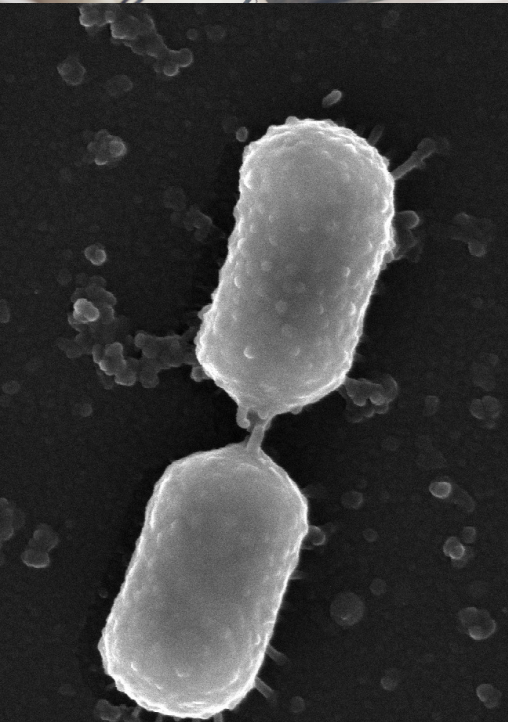

HEREDITUM® IMMUNACTIV K8

Lactobacillus coryniformis CECT5711 K8

The fact that Hereditum® Immunactiv K8 has been shown to improve specific defense against viruses as different as hepatitis or flu, highlights its potential to improve the overall immune response and can be an ally in situations of increased vulnerability to infection.

Hereditum® Immunactiv K8 is an opportunity to contribute to this situation that has affected so many people, providing and promoting health benefits to humankind.

FIRST 1000 DAYS OF LIFE

UNIQUE WINDOW OF OPPORTUNITY TO BUILD HEALTHIER AND MORE PROSPEROUS FUTURES

During the first months of life, the process of microbial colonization influences the development of the immune system, while playing an important role in intestinal physiology and in metabolism. The bacteria that the mother transfers to her children during lactation are key to the proper microbial colonization and the correct development and maturation of the immune system. There are factors such as the type of delivery, the maternal and infant diet and the individual's genetics, which contribute decisively to the process of intestinal colonization. Breastfeeding plays a role that goes beyond nutrition. Breastmilk is a vehicle of communication that transfers immunological factors, bacteria and metabolites. It is important to bear in mind that correct immune development and intestinal colonization in the early stages is key to reducing the risk of disease in both the short and long term.

HEREDITUM® IMMUNACTIV LC40® INFANT

Lactobacillus fermentum CECT5716 LC40®

It is a patent premium probiotic isolated from human breast milk. The efficacy and safety of Hereditum® Immunactiv Infant LC40® have been demonstrated through clinical trials, where it has been shown to reduce the incidence of diarrhea and respiratory infections in children.

As LC40® is a strain isolated from breast milk, it brings the benefits of modulating the immunity provided by breastmilk, being a solution for children who are not breastfed, who are treated with antibiotics, or who are going to start the childcare early.
